SERVICES

The Association required voting for an on-site audience of around 400 participants. The results had to be live displayed and re-voting facilitated in case of ties.

With prior experience of systems in other countries that did not work reliably, the client was very concerned about the stability of the result consolidation process.

SETUP

The Client had many stakeholders involved, and several dry runs were conducted before the on-site setup.

On the setup day, the transponder network was laid out, and frequency testing was conducted. Considering the venue has a relatively poor Wi-Fi network management, band adjustments were made to optimize the free ranges.

On the actual event day, voting pads were distributed to the participants upon registration. A test-vote allowed participants to familiarize themselves with the process. Within the event itself, around 15 elections and voting sequences were triggered and successfully consolidated.

EQUIPMENT

- 400 Voting pads
- Load Balanced 2 Transponders
- Load Balanced network switches
- Video display switch
- 2 Laptops
- Multiple video feeds

A global sports association partnered with Globibo through an event organizer to deliver highly secure voting for 400 participants, including physical voting pads, transponders, and a customizable polling platform. The solution enabled parliamentary voting, as well as elections with an auditable display of the result consolidation.

Globibo's Voting Solution for Congress Elections and Voting for 400 Participants

A prominent conference organizer in Singapore partnered with Globibo to enhance audience engagement and streamline event operations for the congress of a global sports association attended by 400 participants from 200 countries. The client sought a reliable, scalable event technology solution to support real-time voting and seamless content delivery. Most importantly, the client required a team with experience in large-scale events and ad-hoc requirement development.

Globibo provided a comprehensive technology setup, including:

- 400 voting pads for participant interaction
- Load-balanced network of transponders and network switches
- A configurable platform for planned and ad hoc elections and voting

Scrutineers and auditors required visibility of the result consolidation during the execution. This solution enabled the Congress to run all the needed voting sessions smoothly.

Globibo drives engagement at events through reliable and engaging conference equipment. The team develops generative & engaging event technology solutions to help clients excite attendees and create growth opportunities.

MANAGEMENT OF CHALLENGES

Events with many stakeholders add many logistical and communication challenges to technical complexities.

Nobody in the team had a complete understanding of the voting and auditing procedures. Therefore, the Globibo team had to second a senior director to the operations to support the client onsite on changes and adjustments.

The venue has a rather unmanaged wifi network, and many different vendors brought in their own infrastructure that used 2.4 / 5 GHz network bands. To facilitate the reliable connection of hundreds of devices within milliseconds, the network bands had to be properly reviewed repeatedly to optimize the system's response time.

Due to the type of participants, approximately 20-30 individuals did not show up, while around 20-30 others joined. The right (de)tagging of devices was very important to retain consistent and live-auditable voting results.

Globibo drives engagement at events through reliable and engaging conference equipment. The team develops generative & engaging event technology solutions to help clients excite attendees and create growth opportunities.

ROLES / TEAM MEMBERS

•

01

Technical Director

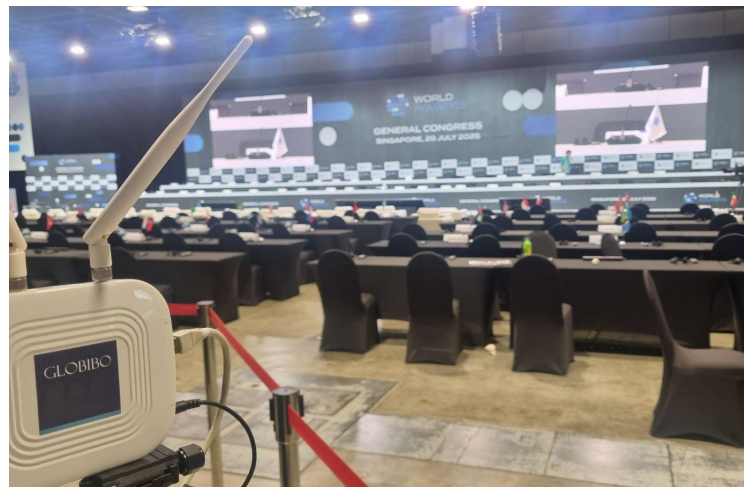

To provide senior advise on the planned preparation as well as live-execution during the event, a senior technical director was committed to the event to support the client team.

02

Voting Manager

The Voting Manager prepared and paired voting pads with the corresponding transponder network, monitored the registration desk as well as system configurations.

The voting manager also reviewed network bands and fine-tuned the settings onsite.
